Problem Discovery and Ideation

Phase 1 | Project-specific interpretation of the supplied ideation templates

Problem statement

A metro passenger needs a single, understandable way to choose a route and see a fare before travelling. In a manual or fragmented process, station names and fare calculation can be inconsistent. The capstone addresses the selection and preview part of this journey using a ServiceNow catalog item. It does not claim a completed payment or issued travel credential.

Project goal: show a passenger-facing route form, consistent station choices, calculated fare, conditional payment input, and an exercise QR preview.

Empathy map (design assumptions, not interview findings)

Perspective	Likely need or concern
Says	I want to choose stations quickly and understand the amount before continuing.
Thinks	Will the selected route and fare be correct?
Does	Selects source, destination, journey type, passenger count, and payment mode.
Feels	More confident when required fields and the displayed amount are clear.

These are product-design assumptions derived from the exercise workflow. No passenger interview or survey is claimed.

Ideas considered and selection

Option	Value	Constraint
Paper or counter-only process	Familiar operational model	Does not demonstrate a self-service digital flow.
Custom standalone ticketing app	Full control of interface	Adds hosting and integration work beyond the capstone.
ServiceNow catalog prototype	Uses the available platform and reusable records	QR and payment remain demonstration-only without external integrations.

Selected approach: ServiceNow Service Catalog and Service Portal. The choice fits the provided platform and enables a testable prototype within the project scope.
