Problem-Solution Fit

Phase 3 | Design assessment based on the configured prototype

Customer and job

Primary user: a metro passenger who needs to choose a route and preview its fare. Secondary user: a ServiceNow administrator who maintains station data, catalog variables, policies, scripts, and widget configuration.

Fit assessment

Problem or constraint	Design response	Current evidence
Inconsistent station entry	Reference fields use Metro Station Details.	27 station records were observed.
Unclear route amount	Fare auto Calculation writes a read-only amount.	One observed sample displayed 11.
Payment detail depends on choice	Fields Visibility UI policy reveals Enter Payment Mode for Others.	Configured policy and portal behavior were observed.
Need a visible digital artifact	QRGeneration opens Metro QR Widget.	A QR modal is shown; submission is cancelled.

Evidence boundary and decision

The prototype fits the exercise goal of demonstrating a coherent selection, fare, and QR-preview flow. It is not evidence of payment processing, a stored ticket, a fulfilled request, or station-gate validation. Those functions require further design and integration.
