Proposed Solution

Phase 3 | Solution scope and implementation choices

Solution outline

Implement Book a Ticket as a ServiceNow catalog item. Use source and destination reference variables backed by Metro Station Details, calculate an amount in a catalog client script, reveal extra payment input through a UI policy, and display an exercise QR image in a Service Portal widget.

Component responsibilities

Component	Responsibility
u_metro_station_details	Maintains the station names used by the two reference fields.
Fare auto Calculation	Maps selected route and passenger count to displayed fare. Its saved trigger is number_of_passengers.
Fields Visibility	Shows and requires Enter Payment Mode when Others is selected.
QRGeneration and metro_qr_widget	Builds an exercise ticket URL, requests a QR image, and displays it in a modal.

Scope and evaluation

In scope: route selection, station lookup, fare display, conditional field behavior, and QR preview. Out of scope in the observed configuration: payment gateway, persisted ticket issuance, request submission after QR display, delivery, and gate validation.

Evaluate with the UAT cases in Phase 5. The documented sample route displayed 11; other fare cases should be checked in the running instance before claiming coverage. The QR script always returns false, so a reviewer should treat the modal as the endpoint of the implemented flow.
