Performance Testing Plan

Phase 5 | Reproducible checks; no benchmark result is claimed

Purpose and current status

This plan defines how to measure the catalog experience. No timed performance run, load test, or accessibility benchmark is evidenced in the available project material. The figures should be filled only after measurements on the configured instance.

Test procedure

Scenario	Measurement	Execution notes
Open Book a Ticket	Time from navigation to usable form.	Repeat five times in the same browser/network; report median and range.
Change route and count	Time until amount updates.	Test the sample route and at least two other valid routes.
Choose Others	Time until extra field appears and validation applies.	Record whether field becomes required.
Open QR preview	Time until modal and image are visible.	Distinguish modal latency from third-party QR image latency.

Recording and acceptance

For each run, record date, browser, device, network, instance state, route, passenger count, elapsed time, and any error. Use browser developer tools for timing and network failures. Report raw observations and variability; do not infer production capacity from one developer instance. If QR image delivery fails, check the external image request separately from the ServiceNow modal.
