Test Plan and UAT Record

Metro Ticket Generating System in ServiceNow | Testing documentation | 11 October 2026

This document gives a repeatable set of functional and performance checks for the metro catalog demonstration. It records expected results and the evidence to capture during a supervised UAT run; it does not invent test outcomes.

1 Environment and Test Data

Environment: ServiceNow Personal Developer Instance. Item: Book a Ticket. Reference data: Metro Station Details with 27 station records. Recommended baseline route: Miyapur to JNTU College, Single Journey, one passenger. Current script mapping shows 11 for that route.

2 Functional Test Cases

ID	Action	Expected result	Evidence
UAT 01	Open portal item	Book a Ticket form loads under Services.	Portal screenshot
UAT 02	Leave source/destination blank	Required indicators prevent an incomplete selection.	Validation screenshot
UAT 03	Choose two station references	Station names resolve from Metro Station Details.	Selected values
UAT 04	Miyapur to JNTU College, single, one passenger	Single fare field displays 11.	Fare screenshot
UAT 05	Choose Return Journey before passenger count	Return field displays twice the mapped one way fare.	Fare screenshot
UAT 06	Choose the same source and destination	No fare quote is produced.	Form screenshot
UAT 07	Choose payment mode Others	Enter Payment Mode appears and is mandatory.	UI policy screenshot
UAT 08	Choose UPI or Card	Enter Payment Mode is hidden.	Form screenshot
UAT 09	Invoke checkout in an approved test	QR modal and Metro QR Widget preview appear.	QR screenshot
UAT 10	Inspect QR destination in an approved test	Encoded destination uses the exercise example.com ticket address.	QR decoding record
UAT 11	Use non-admin test role	Portal is usable while station table follows its ACL rules.	Role test record

3 Demonstrated Configuration Evidence

Check	Recorded configuration
Catalog item	Active Global item Book a Ticket in Service Catalog > Services
Variables	Eight ordered variables
Station data	27 station records in Metro Station Details
UI policy	Fields Visibility for payment mode Others
Scripts	Fare auto Calculation and QRGeneration
Widget	Metro QR Widget with ID metro_qr_widget

4 Performance and Usability Measures

- Record page load time for the portal item on the same browser and network for three runs.
- Record the time between choosing a passenger count and the fare appearing.
- Record the time between invoking the QR action and the modal image appearing.
- Note the browser, network, test account, route, and run date beside each measurement.
- Use the results to compare changes; do not report a target or benchmark without measured data.

5 UAT Recording Sheet

Test ID	Actual result	Pass or fail	Tester and date
UAT 01			
UAT 02

UAT 11			

The tester should attach or link screenshots for each executed case, then sign off only after the actual result has been recorded.
