Project Conclusion

Metro Ticket Generating System in ServiceNow | Conclusion | 11 October 2026

The Metro Ticket Generating System capstone demonstrates how ServiceNow catalog configuration and a small set of scripts can present a digital metro ticket journey from route selection to QR preview.

Conclusion

The project brings station reference data, a passenger-facing catalog form, fare calculation, a conditional payment field, and a dedicated QR widget into one ServiceNow demonstration. The Metro Station Details table supplies consistent station choices. The Fare auto Calculation script turns route and passenger selections into a displayed amount, while QRGeneration and spModal present the exercise QR image through metro_qr_widget. Together, these components show the intended digital journey clearly in Service Portal and give administrators named records they can maintain and explain.

The implementation provides a foundation for a fuller ticket service. Future iterations can use a persisted ticket identifier in the QR payload, send tickets by email or SMS, connect a payment gateway, and add station validation and travel analytics. Those integrations can build on the catalog, reference data, and widget pattern documented in this project.

Submission Checklist

- Attach the final report and supporting documents to the project submission as required.
- Record and upload the demo video, then paste its accessible URL into Skill Wallet.
- Publish a GitHub repository containing the documentation, source snapshots, and selected screenshots; paste its URL into Skill Wallet.
- Review public screenshots and exports for credentials and personal data before publication.
