Demo Video and Presentation Plan

Metro Ticket Generating System in ServiceNow | Demo planning | 11 October 2026

This plan turns the Skill Wallet demo story into a short recording with a clear sequence, narration, and evidence. It distinguishes the exercise QR preview from a live metro gate validation.

1 Recording Goal

Show the passenger-facing Service Portal result first: station choice, fare display, payment mode behavior, and QR preview. Then explain the configuration in dependency order: station table and records, catalog item and variables, UI policy, fare script, QR script, and widget.

2 Preparation

- Sign in to the Personal Developer Instance and open the portal item in one tab.
- Prepare the route Miyapur to JNTU College and choose one passenger after the journey type.
- Open the station table, catalog item, and Metro QR Widget in separate tabs.
- Close unrelated tabs and notifications before recording.
- Keep login credentials, personal data, and tokens out of the recording.

3 Storyboard

Time	Screen	Narration
0:00-0:25	Portal introduction	State the booking problem and ServiceNow catalog solution.
0:25-1:35	Booking form and fare	Choose Miyapur to JNTU College, Single Journey, then one passenger; show amount 11.
1:35-2:15	Payment and QR	Choose Others, fill its required field, click Order Now once, and show the exercise QR modal.
2:15-3:05	Station table	Open System Definition > Tables; show Metro Station Details, Station Name, and 27 records.
3:05-4:15	Catalog item	Open Maintain Items > Book a Ticket; show item details and eight variables.
4:15-5:20	Policy and fare script	Show Fields Visibility and then the Fare auto Calculation onChange script.
5:20-6:30	QR script and widget	Show QRGeneration, its example.com payload and spModal call, then metro_qr_widget; close with the configured flow.

4 Role Perspectives

Requester: the passenger selects a route and sees the calculated amount and QR preview. Administrator or fulfiller: the maintainer checks station records, catalog variable order, UI policy, client scripts, and widget. The saved QRGeneration script returns false on submission, so the video should end the passenger sequence at the preview modal.

5 Evidence Shot List

Shot	Purpose
Booking portal	Shows the user journey and all visible controls.
Station reference table	Shows master data used by the selectors.
Catalog variables	Shows field order and question types.
QR widget	Shows widget ID and HTML image binding.
QRGeneration script	Shows the supplied modal and example QR URL.

6 Presentation Notes

- Use the sequence What, Why, How, Outcome for each slide or section.
- Show the exact configured record names before describing their role.
- Narrate any live action after the result appears on screen.
- Finish with the project conclusion and future scope.
- Upload the final recording to a platform that gives a shareable link. Add that link to Skill Wallet only after opening it in a private browser window to verify access.

7 Suggested Spoken Script

Opening: “This is my Metro Ticket Generating System in ServiceNow. I will show the passenger result first, followed by the station table, catalog configuration, scripts, and QR widget.”

Booking: “I choose Miyapur to JNTU College, Single Journey, and one passenger. The calculated amount displays 11. Both station choices come from the Metro Station Details table.”

Payment and QR: “Choosing Others reveals a required payment field. The checkout action opens the QR preview. The exercise uses an example.com address as its QR payload.”

Administrator view: “The 27-station reference table supplies the form. Book a Ticket has eight variables, one UI policy, and two catalog client scripts. The QR script opens the Metro QR Widget.”

Closing: “This configuration demonstrates station selection, fare display, conditional payment input, and QR presentation in ServiceNow.”

8 Recording Completion Check

- The recording shows the route and visible fare result.
- The payment field behavior and QR widget are visible.
- Record names and the 27-station reference table are readable.
- The video includes narration and does not show credentials.
- The final video link opens for a viewer without the recording account.
